Maximum--127 Vac

Card Specifications

- Notes:
- All Card Dimensions are ± .010 (.254) Tolerance (With Exceptions Indicated on Drawing or in Notes).
 - Max. Card Length is 13.15 (334.01) Smaller Length is Permissible.
 - Loc. and Mounting Holes are Non-Plated Thru. (Loc. 3X, Mtg. 2X).
 - 31 Gold Tabs Each Side, 0.100 ± .0005 (2.54 ± .0127) Center to Center, 0.06 ± .0005 (1.524 ± .0127) Width.
 - Numbers in Parentheses are in Millimeters. All Others are in Inches.

APPENDIX F: COMMUNICATIONS

Information processing equipment used for communications is called data terminal equipment (DTE). Equipment used to connect the DTE to the communications line is called data communications equipment (DCE).

An adapter is used to connect the data terminal equipment to the data communications line as shown in the following illustration:

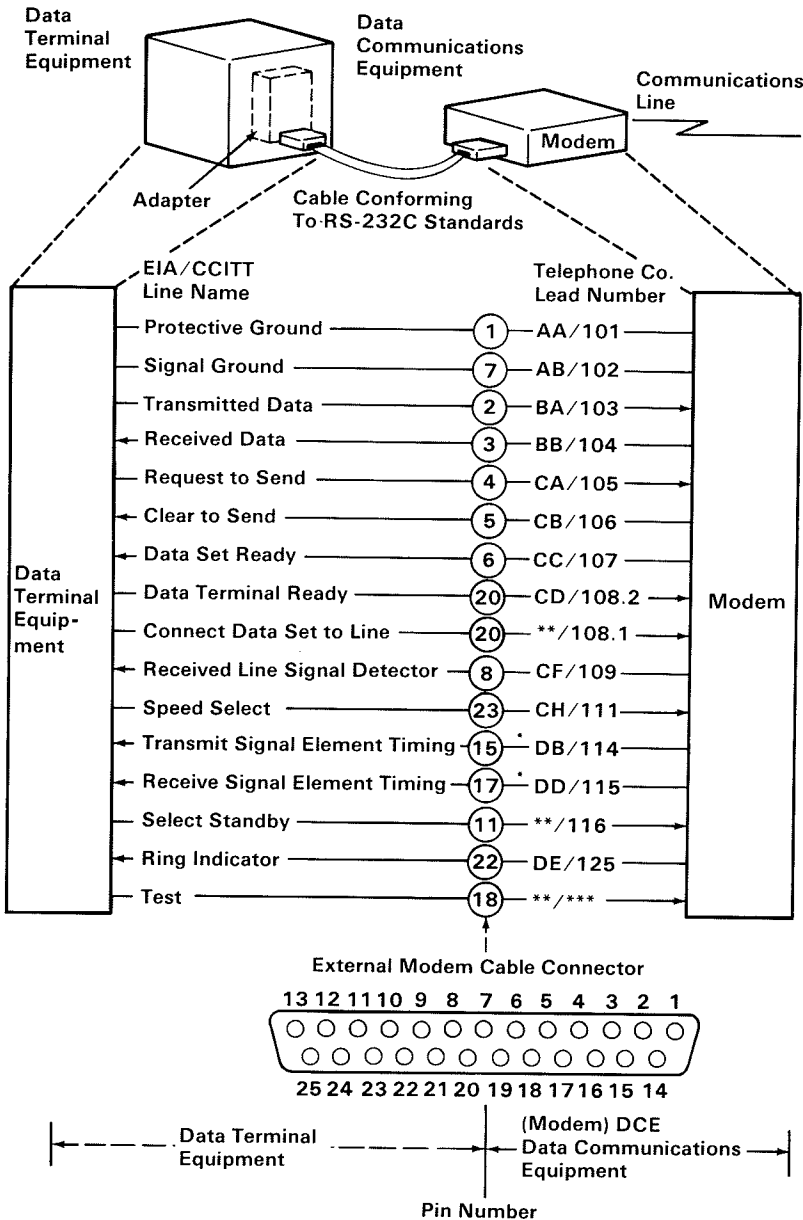

The EIA/CCITT adapter allows data terminal equipment to be connected to data communications equipment using EIA or CCITT standardized connections. An external modem is shown in this example; however, other types of data communications equipment can also be connected to data terminal equipment using EIA or CCITT standardized connections.

EIA standards are labeled RS-x (Recommended Standards-x) and CCITT standards are labeled V.x or X.x, where x is the number of the standard.

The EIA RS-232 interface standard defines the connector type, pin numbers, line names, and signal levels used to connect data terminal equipment to data communications equipment for the purpose of transmitting and receiving data. Since the RS-232 standard was developed, it has been revised three times. The three revised standards are the RS-232A, the RS-232B, and the presently used RS-232C.

The CCITT V.24 interface standard is equivalent to the RS-232C standard; therefore, the descriptions of the EIA standards also apply to the CCITT standards.

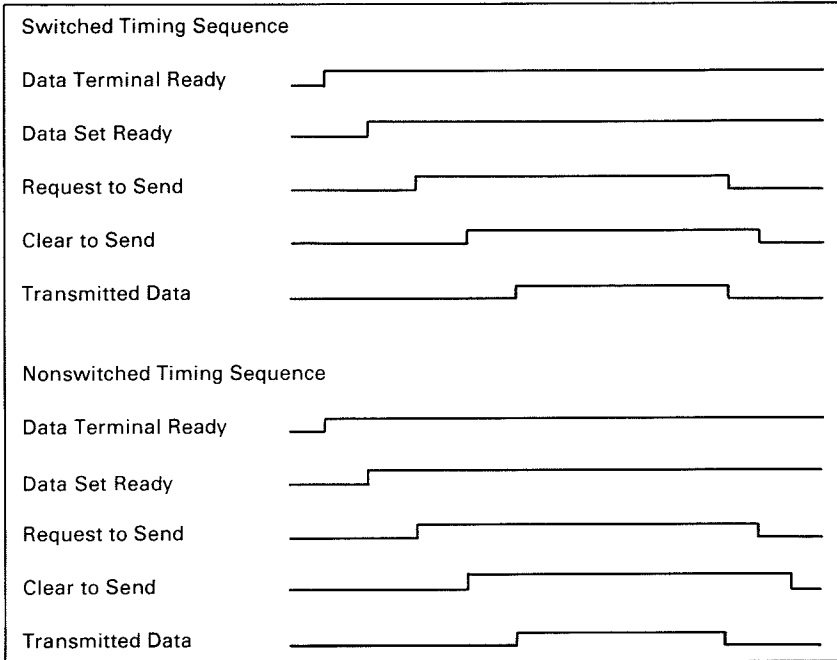

The following is an illustration of data terminal equipment connected to an external modem using connections defined by the RS-232C interface standard:

*Not used when business machine clocking is used.
 **Not standardized by EIA (Electronics Industry Association).
 ***Not standardized by CCITT

Establishing a Communications Link

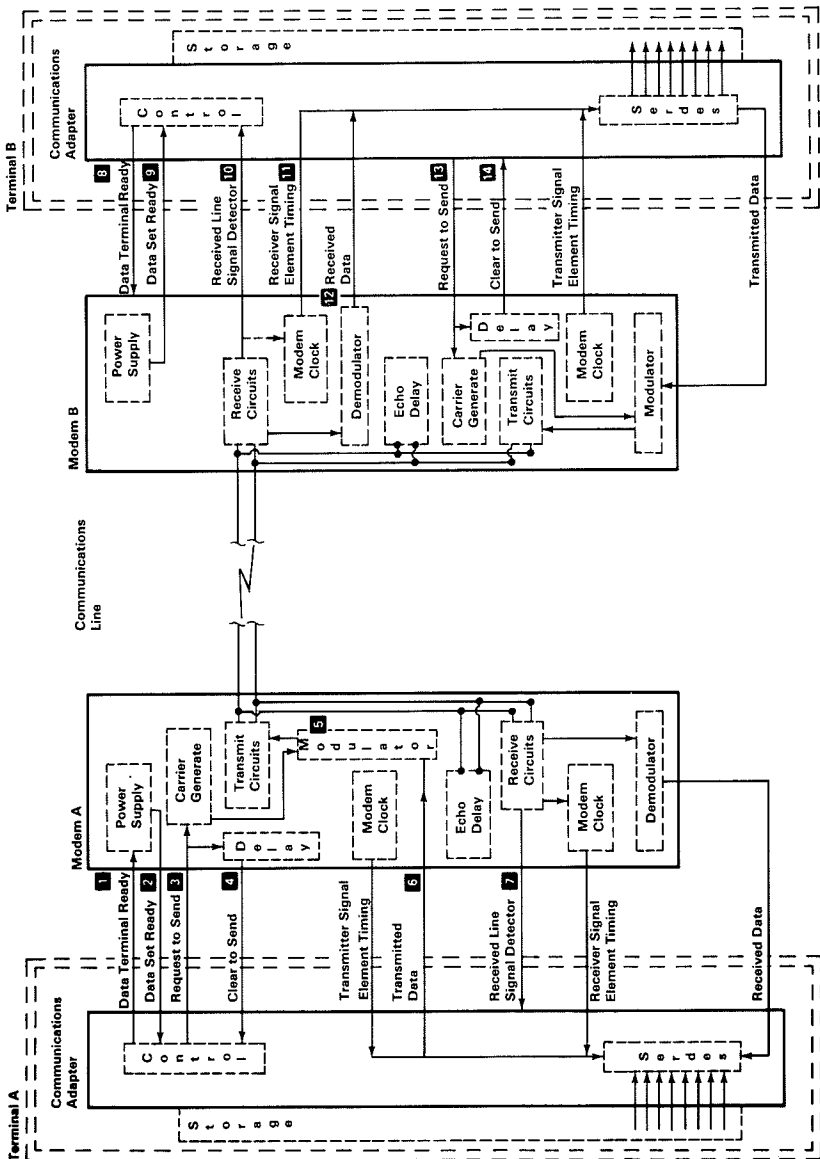

The following bar graphs represent normal timing sequences of operation during the establishment of communications for both switched (dial-up) and nonswitched (direct line) networks.

The following examples show how a link is established on a nonswitched point-to-point line, a nonswitched multipoint line, and a switched point-to-point line.

Establishing a Link on a Nonswitched Point-to-Point Line

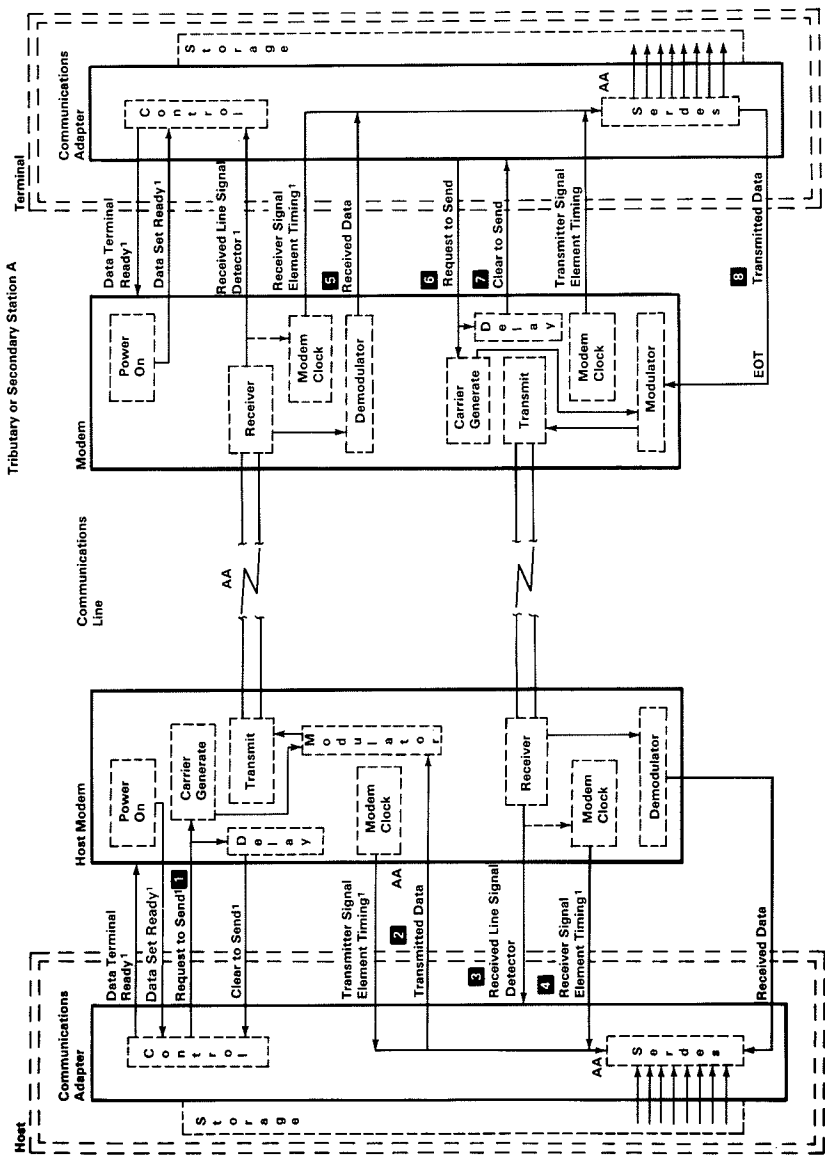

- The terminals at both locations activate the 'data terminal ready' lines **1** and **3**.
- Normally the 'data set ready' lines **2** and **9** from the modems are active whenever the modems are powered on.
- Terminal A activates the 'request to send' line **3**, which causes the modem at terminal A to generate a carrier signal.
- Modem B detects the carrier, and activates the 'received line signal detector' line (sometimes called data carrier detect) **10**. Modem B also activates the 'receiver signal element timing' line (sometimes called receive clock) **11** to send receive clock signals to the terminal. Some modems activate the clock signals whenever the modem is powered on.
- After a specified delay, modem A activates the 'clear to send' line **4**, which indicates to terminal A that the modem is ready to transmit data.
- Terminal A serializes the data to be transmitted (through the serdes) and transmits the data one bit at a time (synchronized by the transmit clock) onto the 'transmitted data' line **6** to the modem.
- The modem modulates the carrier signal with the data and transmits it to the modem B **5**.
- Modem B demodulates the data from the carrier signal and sends it to terminal B on the 'received data' line **12**.
- Terminal B deserializes the data (through the serdes) using the receive clock signals (on the 'receiver signal element timing' line) **11** from the modem.
- After terminal A completes its transmission, it deactivates the 'request to send' line **3**, which causes the modem to turn off the carrier and deactivate the 'clear to send' line **4**.
- Terminal A and modem A now become receivers and wait for a response from terminal B, indicating that all data has reached terminal B. Modem A begins an echo delay (50 to 150 milliseconds) to ensure that all echoes on the line have diminished before it begins receiving. An echo is a reflection of the transmitted signal. If the transmitting modem changed to receive too soon, it could receive a reflection (echo) of the signal it just transmitted.
- Modem B deactivates the 'received line signal detector' line **10** and, if necessary, deactivates the receive clock signals on the 'receiver signal element timing, line **11**.
- Terminal B now becomes the transmitter to respond to the request from terminal A. To transmit data, terminal B activates the 'request to send' line **13**, which causes modem B to transmit a carrier to modem A.
- Modem B begins a delay that is longer than the echo delay at modem A before turning on the 'clear to send' line. The longer delay (called request-to-send to clear-to-send delay) ensures that modem A is ready to receive when terminal B begins transmitting data. After the delay, modem B activates the 'clear to send' line **14** to indicate that terminal B can begin transmitting its response.
- After the echo delay at modem A, modem A senses the carrier from modem B (the carrier was activated in step 13 when terminal B activated the 'request to send' line) and activates the 'received line signal detector' line **7** to terminal A.
- Modem A and terminal A are now ready to receive the response from terminal B. Remember, the response was not transmitted until after the request-to-send to clear-to-send delay at modem B (step 14).

Appendix F

Establishing a Link on a Nonswitched Multipoint Line

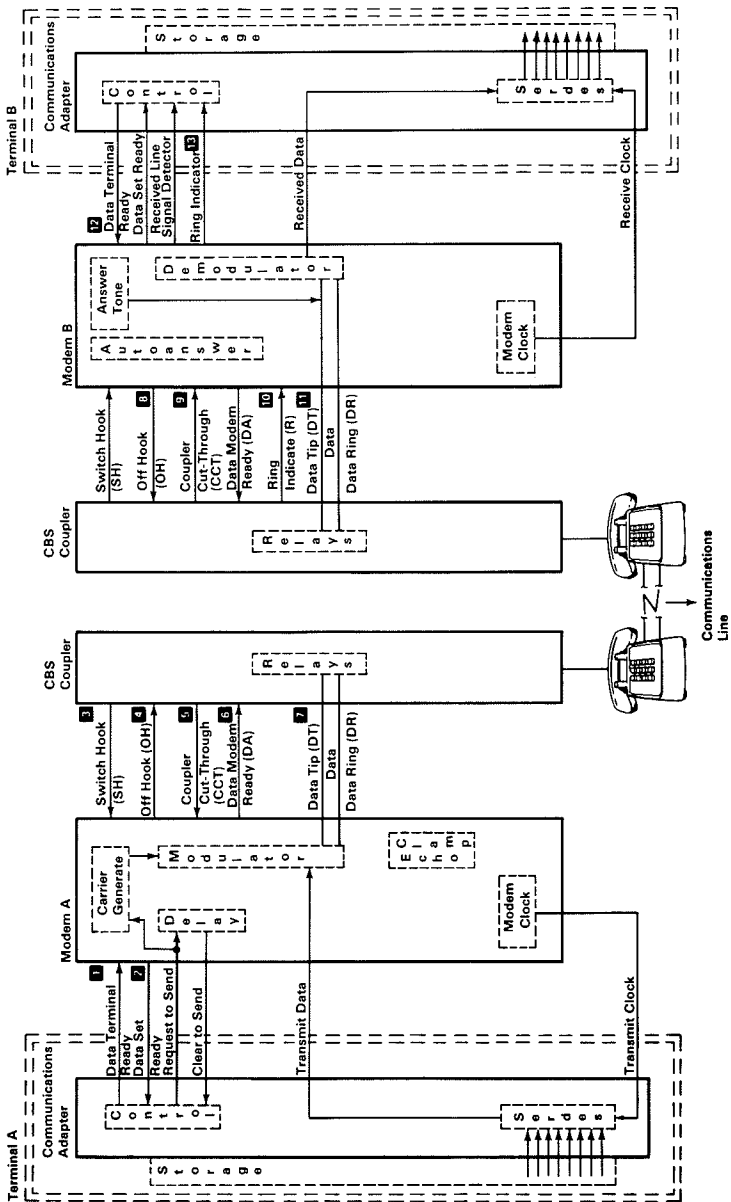

1. The control station serializes the address for the tributary or secondary station (AA) and sends its address to the modem on the 'transmitted data' line **2**.
2. Since the 'request to send' line and, therefore, the modem carrier, is active continuously **1**, the modem immediately modulates the carrier with the address, and, thus, the address is transmitted to all modems on the line.
3. All tributary modems, including the modem for station A, demodulate the address and send it to their terminals on the 'received data' line **5**.
4. Only station A responds to the address; the other stations ignore the address and continue monitoring their 'received data' line. To respond to the poll, station A activates its 'request to send' line **6**, which causes the modem to begin transmitting a carrier signal.
5. The control station's modem receives the carrier and activates the 'received line signal detector, line **3** and the 'receiver signal element timing' line **4** (to send clock signals to the control station). Some modems activate the clock signals as soon as they are powered on.
6. After a short delay to allow the control station modem to receive the carrier, the tributary modem activates the 'clear to send' line **7**.
7. When station A detects the active 'clear to send' line, it transmits its response. (For this example, assume that station A has no data to send; therefore, it transmits an EOT **8**.)
8. After transmitting the EOT, station A deactivates the 'request to send' line **6**. This causes the modem to deactivate the carrier and the 'clear to send' line **7**.
9. When the modem at the control station (host) detects the absence of the carrier, it deactivates the 'received line signal detector' line **3**.
10. Tributary station A is now in receive mode waiting for the next poll or select transmission from the control station.

¹These lines are active continuously.

Establishing a Link on a Switched Point-To-Point Line

1. Terminal A is in communications mode; therefore, the 'data terminal ready' line **1** is active. Terminal B is in communication mode waiting for a call from terminal A.
 2. When the terminal A operator lifts the telephone handset, the 'switch hook' line from the coupler is activated **3**.
 3. Modem A detects the 'switch hook' line and activates the 'off hook' line **4**, which causes the coupler to connect the telephone set to the line and activate the 'coupler cut-through' line **5** to the modem.
 4. Modem A activates the 'data modem ready' line **6** to the coupler (the 'data modem ready' line is on continuously in some modems).
 5. The terminal A operator sets the exclusion key or talk/data switch to the talk position to connect the communications line. The operator then dials the terminal B number.
 6. When the telephone at terminal B rings, the coupler activates the 'ring indicate' line to modem B **10**. Modem B indicates that the 'ring indicate' line was activated by activating the 'ring indicator' line **13** to terminal B.
 7. Terminal B activates the 'data terminal ready' line to modem B **12**, which activates the autoanswer circuits in modem B. (The 'data terminal ready' line might already be active in some terminals.)
 8. The autoanswer circuits in modem B activate the 'off hook' line to the coupler **8**.
 9. The coupler connects modem B to the communications line through the 'data tip' and 'data ring' lines **11** and activates the 'coupler cut-through' line **9** to the modem. Modem B then transmits an answer tone to terminal A.
 10. The terminal A operator hears the tone and sets the exclusion key or talk/data switch to the data position (or performs an equivalent operation) to connect modem A to the communications line through the 'data tip' and 'data ring' lines **7**.
 11. The coupler at terminal A deactivates the 'switch hook' line **3**. This causes modem A to activate the 'data set ready' line **2** indicating to terminal A that the modem is connected to the communications line.
- The sequence of the remaining steps to establish the data link is the same as the sequence required on a nonswitched point-to-point line. When the terminals have completed their transmission, they both deactivate the 'data terminal ready' line to disconnect the modems from the line.

Notes:

APPENDIX G: SWITCH SETTINGS

The following switch settings are divided between two groups. The first group contains the switch settings for the 16/64K system board. The second group contains the 64/256K system board switch settings.

Determine the system board type and refer to the appropriate group of switch settings for all applications.

Switch Settings (16KB-64KB CPU)	G-3
Switch Settings (64KB-256KB CPU)	G-29

Switch Setting Charts

System Board Switches

WARNING: Before you change any switch settings, make a note of how the switches are presently set.

Switch Block 1

Switch	Function
1,7,8	Number of 5-1/4 inch diskette drives installed
2	Math Coprocessor
3,4	System board memory switches
5,6	Type(s) of display(s) connected

Switch Block 2

Switch	Function
1,2,3,4,5	Amount of memory options installed
6,7,8	Always in the Off position

Number of 5-1/4 Inch Diskette Drives Installed

	Switch Block 1	Switch Block 2
0 – Drives		
1 – Drive		
2 – Drives		

Type(s) of display(s) connected

WARNING:

If an IBM Monochrome Display is connected to your system. Switch Block 1, switches 5 and 6, must always be Off. Damage to your display can result with any other switch settings.

	Switch Block 1	Switch Block 2	
IBM Monochrome Display (or IBM Monochrome Display plus another display)			
Color Display (Do not use if an IBM Monochrome Display is connected)			40x25 Mode
			80x25 Mode

Note: The 40x25 mode means there will be 40 characters across the screen and 25 lines down the screen. The 80x25 mode means there will be 80 characters across the screen and 25 lines down the screen. The 80x25 mode, when used with home televisions and various displays, can cause loss of character quality.

Notes:

GLOSSARY

μs: Microsecond.

adapter: An auxiliary system or unit used to extend the operation of another system.

address bus: One or more conductors used to carry the binary-coded address from the microprocessor throughout the rest of the system.

all points addressable (APA): A mode in which all points on a displayable image can be controlled by the user.

alphanumeric (A/N): Pertaining to a character set that contains letters, digits, and usually other characters, such as punctuation marks. Synonymous with alphanumeric.

American Standard Code for Information Interchange (ASCII): The standard code, using a coded character set consisting of 7-bit coded characters (8 bits including parity check), used for information interchange among data processing systems, data communication systems and associated equipment. The ASCII set consists of control characters and graphic characters.

A/N: Alphanumeric.

analog: (1) pertaining to data in the form of continuously variable physical quantities. (2) Contrast with digital.

AND: A logic operator having the property that if P is a statement, Q is a statement, R is a statement,...,then the AND of P, Q, R,...is true if all statements are true, false if any statement is false.

APA: All points addressable.

ASCII: American Standard Code for Information Interchange.

assembler: A computer program used to assemble. Synonymous with assembly program.

asynchronous communications: A communication mode in which each single byte of data is synchronized, usually by the addition of start/stop bits.

BASIC: Beginner's all-purpose symbolic instruction code.

basic input/output system (BIOS): Provides the device level control of the major I/O devices in a computer system, which provides an operational interface to the system and relieves the programmer from concern over hardware device characteristics.

baud: (1) A unit of signaling speed equal to the number of discrete conditions or signal events per second. For example, one baud equals one-half dot cycle per second in Morse code, one bit per second in a train of binary signals, and one 3-bit value per second in a train of signals each of which can assume one of eight different states. (2) In asynchronous transmission, the unit of modulation rate corresponding to one unit of interval per second; that is, if the duration of the unit interval is 20 milliseconds, the modulation rate is 50 baud.

BCC: Block-check character.

beginner's all-purpose symbolic instruction code (BASIC): A programming language with a small repertoire of commands and a simple syntax, primarily designed for numerical application.

binary: (1) Pertaining to a selection, choice, or condition that has two possible values or states. (2) Pertaining to a fixed radix numeration system having a radix of two.

binary digit: (1) In binary notation, either of the characters 0 or 1. (2) Synonymous with bit.

binary notation: Any notation that uses two different characters, usually the binary digits 0 and 1.

binary synchronous communications (BSC): A standardized procedure, using a set of control characters and control character sequences for synchronous transmission of binary-coded data between stations.

BIOS: Basic input/output system.

bit: In binary notation, either of the characters 0 or 1.

bits per second (bps): A unit of measurement representing the number of discrete binary digits which can be transmitted by a device in one second.

block-check character (BCC): In cyclic redundancy checking, a character that is transmitted by the sender after each message block and is compared with a block-check character computed by the receiver to determine if the transmission was successful.

boolean operation: (1) Any operation in which each of the operands and the result take one of two values. (2) An operation that follows the rules of boolean algebra.

bootstrap: A technique or device designed to bring itself into a desired state by means of its own action; that is, a machine routine whose first few instructions are sufficient to bring the rest of itself into the computer from an input device.

bps: Bits per second.

BSC: Binary synchronous communications.

buffer: (1) An area of storage that is temporarily reserved for use in performing an input/output operation, into which data is read or from which data is written. Synonymous with I/O area. (2) A portion of storage for temporarily holding input or output data.

bus: One or more conductors used for transmitting signals or power.

byte: (1) A binary character operated upon as a unit and usually shorter than a computer word. (2) The representation of a character.

CAS: Column address strobe.

cathode ray tube (CRT): A vacuum tube display in which a beam of electrons can be controlled to form alphanumeric characters or symbols on a luminescent screen, for example by use of a dot matrix.

cathode ray tube display (CRT display): (1) A device that presents data in visual form by means of controlled electron beams. (2) The data display produced by the device as in (1).

CCITT: Comite Consultatif International Telegraphique et Telephonique.

central processing unit (CPU): A functional unit that consists of one or more processors and all or part of internal storage.

channel: A path along which signals can be sent; for example, data channel or I/O channel.

characters per second (cps): A standard unit of measurement for printer output.

code: (1) A set of unambiguous rules specifying the manner in which data may be represented in a discrete form. Synonymous with coding scheme. (2) A set of items, such as abbreviations, representing the members of another set. (3) Loosely, one or more computer programs, or part of a computer program. (4) To represent data or a computer program in a symbolic form that can be accepted by a data processor.

column address strobe (CAS): A signal that latches the column addresses in a memory chip.

Comite Consultatif International Telegraphique et Telephonique (CCITT): Consultative Committee on International Telegraphy and Telephony.

computer: A functional unit that can perform substantial computation, including numerous arithmetic operations, or logic operations, without intervention by a human operator during the run.

configuration: (1) The arrangement of a computer system or network as defined by the nature, number, and the chief characteristics of its functional units. More specifically, the term configuration may refer to a hardware configuration or a software configuration. (2) The devices and programs that make up a system, subsystem, or network.

conjunction: (1) The boolean operation whose result has the boolean value 1 if, and only if, each operand has the boolean value 1. (2) Synonymous with AND operation.

contiguous: (1) Touching or joining at the edge or boundary. (2) Adjacent.

CPS: Characters per second.

CPU: Central processing unit.

CRC: Cyclic redundancy check.

CRT: Cathode ray tube.

CRT display: Cathode ray tube display.

CTS: Clear to send. Associated with modem control.

cyclic redundancy check (CRC): (1) A redundancy check in which the check key is generated by a cyclic algorithm. (2) A system of error checking performed at both the sending and receiving station after a block-check character has been accumulated.

cylinder: (1) The set of all tracks with the same nominal distance from the axis about which the disk rotates. (2) The tracks of a disk storage device that can be accessed without repositioning the access mechanism.

daisy-chained cable: A type of cable that has two or more connectors attached in series.

data: (1) A representation of facts, concepts, or instructions in a formalized manner suitable for communication, interpretation, or processing by humans or automatic means. (2) Any representations, such as characters or analog quantities, to which meaning is, or might be assigned.

decoupling capacitor: A capacitor that provides a low-impedance path to ground to prevent common coupling between states of a circuit.

Deutsche Industrie Norm (DIN): (1) German Industrial Norm. (2) The committee that sets German dimension standards.

digit: (1) A graphic character that represents an integer, for example, one of the characters 0 to 9. (2) A symbol that represents one of the non-negative integers smaller than the radix. For example, in decimal notation, a digit is one of the characters from 0 to 9.

digital: (1) Pertaining to data in the form of digits. (2) Contrast with analog.

DIN: Deutsche Industrie Norm.

DIN connector: One of the connectors specified by the DIN standardization committee.

DIP: Dual in-line package.

direct memory access (DMA): A method of transferring data between main storage and I/O devices that does not require processor intervention.

disk: Loosely, a magnetic disk unit.

diskette: A thin, flexible magnetic disk and a semi-rigid protective jacket, in which the disk is permanently enclosed. Synonymous with flexible disk.

DMA: Direct memory access.

DSR: Data set ready. Associated with modem control.

DTR: Data terminal ready. Associated with modem control.

dual in-line package (DIP): A widely used container for an integrated circuit. DIPs are pins usually in two parallel rows. These pins are spaced 1/10 inch apart and come in different configurations ranging from 14-pin to 40-pin configurations.

EBCDIC: Extended binary-coded decimal interchange code.

ECC: Error checking and correction.

edge connector: A terminal block with a number of contacts attached to the edge of a printed circuit board to facilitate plugging into a foundation circuit.

EIA: Electronic Industries Association.

EIA/CCITT: Electronics Industries Association/Consultative Committee on International Telegraphy and Telephony.

end-of-text-character (ETX): A transmission control character used to terminate text.

end-of-transmission character (EOT): A transmission control character used to indicate the conclusion of a transmission, which may have included one or more texts and any associated message headings.

EOT: End-of-transmission character.

EPROM: Erasable programmable read-only memory.

erasable programmable read-only memory (EPROM): A storage device whose contents can be changed by electrical means. EPROM information is not destroyed when power is removed.

error checking and correction (ECC): The detection and correction of all single-bit, double-bit, and some multiple-bit errors.

ETX: End-of-text character.

extended binary-coded decimal interchange code (EBCDIC): A set of 256 characters, each represented by eight bits.

flexible disk: Synonym for diskette.

firmware: Memory chips with integrated programs already incorporated on the chip.

gate: (1) A device or circuit that has no output until it is triggered into operation by one or more enabling signals, or until an input signal exceeds a predetermined threshold amplitude. (2) A signal that triggers the passage of other signals through a circuit.

graphic: A symbol produced by a process such as handwriting, drawing, or printing.

hertz (Hz): A unit of frequency equal to one cycle per second.

hex: Abbreviation for hexadecimal.

hexadecimal: Pertaining to a selection, choice, or condition that has 16 possible values or states. These values or states usually contain 10 digits and 6 letters, A through F. Hexadecimal digits are equivalent to a power of 16.

high-order position: The leftmost position in a string of characters.

Hz: Hertz.

interface: A device that alters or converts actual electrical signals between distinct devices, programs, or systems.

k: An abbreviation for the prefix kilo; that is, 1,000 in decimal notation.

K: When referring to storage capacity, 2 to the tenth power; 1,024 in decimal notation.

KB: Kilobyte; 1,024 bytes.

kHz: A unit of frequency equal to 1,000 hertz.

kilo (k): One thousand.

latch: (1) A feedback loop in symmetrical digital circuits used to maintain a state. (2) A simple logic-circuit storage element comprising two gates as a unit.

LED: Light-emitting diode.

light-emitting diode (LED): A semi-conductor chip that gives off visible or infrared light when activated.

low-order position: The rightmost position in a string of characters.

m: (1) Milli; one thousand or thousandth part. (2) Meter.

M: Mega; 1,000,000 in decimal notation. When referring to storage capacity, 2 to the twentieth power; 1,048,576 in decimal notation.

mA: Milliampere.

machine language: (1) A language that is used directly by a machine. (2) Another term for computer instruction code.

main storage: A storage device in which the access time is effectively independent of the location of the data.

MB: Megabyte, 1,048,576 bytes.

mega (M): 10 to the sixth power, 1,000,000 in decimal notation. When referring to storage capacity, 2 to the twentieth power, 1,048,576 in decimal notation.

megabyte (MB): 1,048,576 bytes.

megahertz (MHz): A unit of measure of frequency. 1 megahertz equals 1,000,000 hertz.

MFM: Modified frequency modulation.

MHz: Megahertz.

microprocessor: An integrated circuit that accepts coded instructions for execution; the instructions may be entered, integrated, or stored internally.

microsecond (μ s): One-millionth of a second.

milli (m): One thousand or one thousandth.

milliampere (mA): One thousandth of an ampere.

millisecond (ms): One thousandth of a second.

mnemonic: A symbol chosen to assist the human memory; for example, an abbreviation such a “mpy” for “multiply.”

mode: (1) A method of operation; for example, the binary mode, the interpretive mode, the alphanumeric mode. (2) The most frequency value in the statistical sense.

modem: (Modulator-Demodulator) A device that converts serial (bit by bit) digital signals from a business machine (or data terminal equipment) to analog signals which are suitable for transmission in a telephone network. The inverse function is also performed by the modem on reception of analog signals.

modified frequency modulation (MFM): The process of varying the amplitude and frequency of the “write” signal. MFM pertains to the number of bytes of storage that can be stored on the recording media. The number of bytes is twice the number contained in the same unit area of recording media at single density.

modulo check: A calculation performed on values entered into a system. This calculation is designed to detect errors.

monitor: (1) A device that observes and verifies the operation of a data processing system and indicates any specific departure from the norm. (2) A television type display, such as the IBM Monochrome Display. (3) Software or hardware that observes, supervises, controls, or verifies the operations of a system.

ms: Millisecond; one thousandth of a second.

multiplexer: A device capable of interleaving the events of two or more activities, or capable of distributing the events of an interleaved sequence to the respective activities.

NAND: A logic operator having the property that if P is a statement, Q is a statement, R is a statement,....,then the NAND of P,Q,R,...is true if at least one statement is false, false if all statements are true.

nanosecond (ns): One-thousandth-millionth of a second.

nonconjunction: The dyadic boolean operation the result of which has the boolean value 0 if, and only if, each operand has the boolean value 1.

non-return-to-zero inverted (NRZI): A transmission encoding method in which the data terminal equipment changes the signal to the opposite state to send a binary 0 and leaves it in the same state to send a binary 1.

NOR: A logic operator having the property that if P is a statement, Q is a statement, R is a statement,...,then the NOR of P,Q,R,...is true if all statements are false, false if at least one statement is true.

NOT: A logical operator having the property that if P is a statement, then the NOT of P is true if P is false, false if P is true.

NRZI: Non-return-to-zero inverted.

ns: Nanosecond; one-thousandth-millionth of a second.

operating system: Software that controls the execution of programs; an operating system may provide services such as resource allocation, scheduling, input/output control, and data management.

OR: A logic operator having the property that if P is a statement, Q is a statement, R is a statement,...,then the OR of P,Q,R,...is true if at least one statement is true, false if all statements are false.

output: Pertaining to a device, process, or channel involved in an output process, or to the data or states involved in an output process.

output process: (1) The process that consists of the delivery of data from a data processing system, or from any part of it. (2) The return of information from a data processing system to an end user, including the translation of data from a machine language to a language that the end user can understand.

overcurrent: A current of higher than specified strength.

overvoltage: A voltage of higher than specified value.

parallel: (1) Pertaining to the concurrent or simultaneous operation of two or more devices, or to the concurrent performance of two or more activities. (2) Pertaining to the concurrent or simultaneous occurrence of two or more related activities in multiple devices or channels. (3) Pertaining to the simultaneity of two or more processes. (4) Pertaining to the simultaneous processing of the individual parts of a whole, such as the bits of a character and the characters of a word, using separate facilities for the various parts. (5) Contrast with serial.

PEL: Picture element.

personal computer: A small home or business computer that has a processor and keyboard that can be connected to a television or some other monitor. An optional printer is usually available.

picture element (PEL): (1) The smallest displayable unit on a display. (2) Synonymous with pixel, PEL.

pinout: A diagram of functioning pins on a pinboard.

pixel: Picture element.

polling: (1) Interrogation of devices for purposes such as to avoid contention, to determine operational status, or to determine readiness to send or receive data. (2) The process whereby stations are invited, one at a time, to transmit.

port: An access point for data entry or exit.

printed circuit board: A piece of material, usually fiberglass, that contains a layer of conductive material, usually metal. Miniature electronic components on the fiberglass transmit electronic signals through the board by way of the metal layers.

program: (1) A series of actions designed to achieve a certain result. (2) A series of instructions telling the computer how to handle a problem or task. (3) To design, write, and test computer programs.

programming language: (1) An artificial language established for expressing computer programs. (2) A set of characters and rules, with meanings assigned prior to their use, for writing computer programs.

PROM: Programmable read-only memory.

propagation delay: The time necessary for a signal to travel from one point on a circuit to another.

radix: (1) In a radix numeration system, the positive integer by which the weight of the digit place is multiplied to obtain the weight of the digit place with the next higher weight; for example, in the decimal numeration system, the radix of each digit place is 10. (2) Another term for base.

radix numeration system: A positional representation system in which the ratio of the weight of any one digit place to the weight of the digit place with the next lower weight is a positive integer. The permissible values of the character in any digit place range from zero to one less than the radix of the digit place.

RAS: Row address strobe.

RGBI: Red-green-blue-intensity.

read-only memory (ROM): A storage device whose contents cannot be modified, except by a particular user, or when operating under particular conditions; for example, a storage device in which writing is prevented by a lockout.

read/write memory: A storage device whose contents can be modified.

red-green-blue-intensity (RGBI): The description of a direct-drive color monitor which accepts red, green, blue, and intensity signal inputs.

register: (1) A storage device, having a specified storage capacity such as a bit, a byte, or a computer word, and usually intended for a special purpose. (2) On a calculator, a storage device in which specific data is stored.

RF modulator: The device used to convert the composite video signal to the antenna level input of a home TV.

ROM: Read-only memory.

ROM/BIOS: The ROM resident basic input/output system, which provides the device level control of the major I/O devices in the computer system.

row address strobe (RAS): A signal that latches the row addresses in a memory chip.

RS-232C: The standard set by the EIA for communications between computers and external equipment.

RTS: Request to send. Associated with modem control.

run: A single continuous performance of a computer program or routine.

scan line: The use of a cathode beam to test the cathode ray tube of a display used with a personal computer.

schematic: The description, usually in diagram form, of the logical and physical structure of an entire data base according to a conceptual model.

SDLC: Synchronous Data Link Control.

sector: That part of a track or band on a magnetic drum, a magnetic disk, or a disk pack that can be accessed by the magnetic heads in the course of a predetermined rotational displacement of the particular device.

serdes: Serializer/deserializer.

serial: (1) Pertaining to the sequential performance of two or more activities in a single device. In English, the modifiers serial and parallel usually refer to devices, as opposed to sequential and consecutive, which refer to processes. (2) Pertaining to the sequential or consecutive occurrence of two or more related activities in a single device or channel. (3) Pertaining to the sequential processing of the individual parts of a whole, such as the bits of a character or the characters of a word, using the same facilities for successive parts. (4) Contrast with parallel.

sink: A device or circuit into which current drains.

software: (1) Computer programs, procedures, rules, and possibly associated documentation concerned with the operation of a data processing system. (2) Contrast with hardware.

source: The origin of a signal or electrical energy.

source circuit: (1) Generator circuit. (2) Control with sink.

SS: Start-stop transmission.

start bit: Synonym for start signal.

start-of-text character (STX): A transmission control character that precedes a text and may be used to terminate the message heading.

start signal: (1) A signal to a receiving mechanism to get ready to receive data or perform a function. (2) In a start-stop system, a signal preceding a character or block that prepares the receiving device for the reception of the code elements. Synonymous with start bit.

start-stop (SS) transmission: Asynchronous transmission such that a group of signals representing a character is preceded by a start signal and followed by a stop signal. (2) Asynchronous transmission in which a group of bits is preceded by a start bit that prepares the receiving mechanism for the reception and registration of a character and is followed by at least one stop bit that enables the receiving mechanism to come to an idle condition pending the reception of the next character.

stop bit: Synonym for stop signal.

stop signal: (1) A signal to a receiving mechanism to wait for the next signal. (2) In a start-stop system, a signal following a character or block that prepares the receiving device for the reception of a subsequent character or block. Synonymous with stop bit.

stroke: (1) An instrument used to determine the exact speed of circular or cyclic movement. (2) A flashing signal displaying an exact event.

STX: Start-of-text character.

Synchronous Data Link Control (SLDC): A protocol for the management of data transfer over a data communications link.

synchronous transmission: Data transmission in which the sending and receiving devices are operating continuously at the same frequency and are maintained, by means of correction, in a desired phase relationship.

text: In ASCII and data communication, a sequence of characters treated as an entity if preceded and terminated by one STX and one ETX transmission control, respectively.

track: (1) The path or one of the set of paths, parallel to the reference edge on a data medium, associated with a single reading or writing component as the data medium moves past the component. (2) The portion of a moving data medium such as a drum, tape, or disk, that is accessible to a given reading head position.

transistor-transistor logic (TTL): A circuit in which the multiple-diode cluster of the diode-transistor logic circuit has been replaced by a multiple-emitter transistor.

TTL: Transistor-transistor logic.

TX Data: Transmit data. Associated with modem control. External connections of the RS-232C asynchronous communications adapter interface.

video: Computer data or graphics displayed on a cathode ray tube, monitor or display.

write precompensation: The varying of the timing of the head current from the outer tracks to the inner tracks of the diskette to keep a constant write signal.

BIBLIOGRAPHY

Intel Corporation. *The 8086 Family User's Manual*

This manual introduces the 8086 family of microcomputing components and serves as a reference in system design and implementation.

Intel Corporation. *8086/8087/8088 Macro Assembly Reference Manual for 8088/8085 Based Development System*

This manual describes the 8086/8087/8088 Macro Assembly Language, and is intended for use by persons who are familiar with assembly language.

Intel Corporation. *Component Data Catalog*

This book describes Intel components and their technical specifications.

Motorola, Inc. *The Complete Microcomputer Data Library.*

This book describes Motorola components and their technical specifications.

National Semiconductor Corporation. *INS 8250 Asynchronous Communications Element.* This book documents physical and operating characteristics of the INS 8250.
